

E46LTWA

AUTOMATIC TOOL SEARCH AND MEASUREMENT

The E46LTWA presetter integrates the AUTOFOCUS function, essential for the automatic search and measurement of the tool.

There is no limit to the possibilities: E46LTWA is able to recognize the tool type, without data entry, and adapt to any situation.

The presetter detects and measures all the tool cutting edges, presenting them in graphic form for a quick and precise visualization, thanks to the complete revolution of the spindle.

Made to measure for you.

DXF PROFILE CREATION

DXF profile creation function is an easy operation: the tool rotates 360° automatically.

The presetter memorizes the development of revolution, generates the drawing in DXF and exports the results in DXF format.

Moreover, E46LTWA offers you the possibility to import a DXF drawing for real tool control. Overlapping the drawing with the image makes everything easier.

The spindle holder identification system (SP-ID) allows the presetter to identify the spindle-holder and suggests the correct machine origins.

ADVANCED. AUTOMATIC. PRECISE.
